Pros

- There is evidence that introducing job search requirements for older unemployed people in the Netherlands increases their outflow rate into jobs.
- The financial strain imposed by older workers on the unemployment insurance system is reduced if older workers are re-employed sooner.
- Evidence for Germany shows that older unemployed workers receive higher reservation wages if they are exempted from job search requirements, indicating that there is a reduced incentive to accept jobs.
- Monitoring and sanctioning stimulate the unemployed to meet their search requirements.

Cons

- Evidence for the Netherlands shows that a side effect of reintroducing job search requirements for the older unemployed is inflow into sickness and disability insurance schemes.
- Monitoring and screening the search efforts of older workers entails implementation costs.
- For older workers with a skill mismatch and long unemployment spells, job search effectiveness can be limited.
- Re-employment problems of older workers due to restrictions from the demand side of the labor market cannot be solved by search requirements.

AUTHOR’S MAIN MESSAGE

Policies aimed at activating older workers are particularly important for many OECD countries which have aging populations. Empirical evidence suggests that removing exemptions from job search requirements for older unemployed people will increase their flow out of unemployment and into jobs. A possible negative side effect from this action is the increased flow from unemployment into inactivity, such as disability. Overall, job search requirements for the older unemployed, in combination with a system of monitoring and sanctions that guarantees their credibility, can lead to improved re-employment for older workers.
